

How to set up Azure Virtual Desktop

1. Open the Windows App

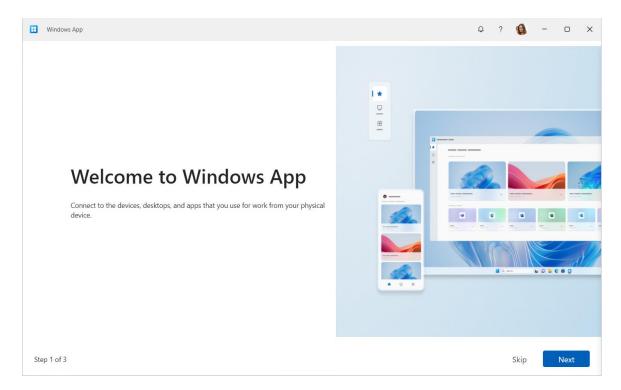

- a. On a Capital Power computer, open Window App from the **Start Menu**.
- b. On a personal computer, Download and install <u>Windows App from the Microsoft Store</u>. When Windows App is installed, open it from the **Start Menu**.

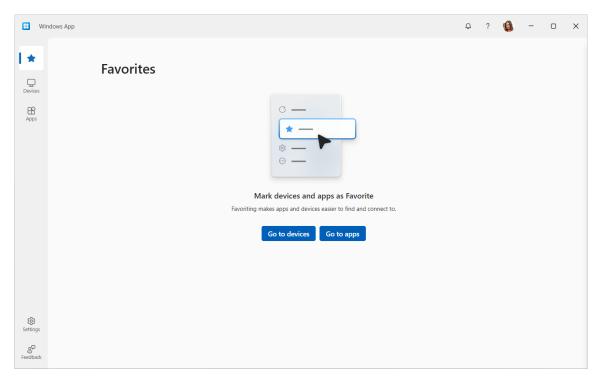

- 2. Select **Sign in** and sign in with your user account for Azure Virtual Desktop. If you're using a local CP Windows device, you are signed in automatically.
- 3. If it's your first time using Windows App, navigate through the tour to learn more about Windows App, then select **Done**, or select **Skip**.

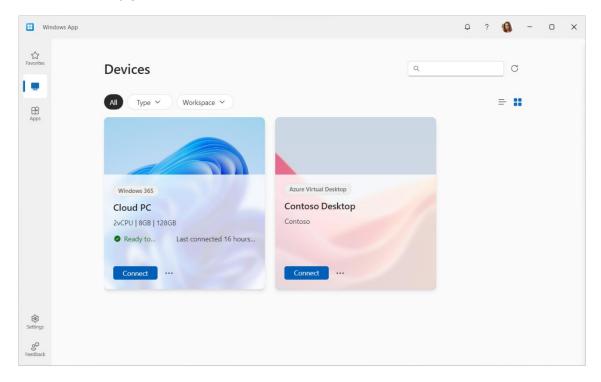

4. After you sign in, select the **Devices** tab or **Apps** tab to show your remote resources from Azure Virtual Desktop and any other services you have access to. Tabs are hidden if you don't have that type of resource assigned to you. If you don't see any devices or apps, contact your administrator.

5. Find the device or app you want to connect to. You can use the search box and filters to help you.

- 6. Select **Connect** on a device or select an app to connect. You might be prompted to enter the password for your user account again, depending on how your administrator configures Azure Virtual Desktop.
- 7. Once the connection to your device or app is complete, you're ready to start using it.

Tip

You can pin your favorite desktops and apps to the Favorites tab for quick access.
To learn more, see <u>Device and app actions in Windows App</u>.
